Trail by Fury by Aaron Klein

Patenting the Sun by Jane Smith

Note: most media outlets are owned by corporate entities and are thus biased. This is why you won't see anything against vaccines in regular news anymore. It is necessary to look in new locations for information.

Aluminum (promote antibody response)

What CDC says: while it is regarded as safe, there are limits for air, products, and drinking water

What others say: implicated in brain damage, suspected in Alzheimer's, dementia, seizures, comas. Allergic reactions on skin.

Vaccine(s) containing it: almost all

Formaldehyde (disinfectant)

What CDC says: known carcinogen, nasal and eye irritant, neurological effects, asthma, allergies, eczema

What others say: suspected gastrointestinal, liver, immune system, nerve, reproductive system, and respiratory poison

Vaccine(s) containing it: almost all

MSG

What CDC says: why it's added

What others say: being studied for mutagenic, teratogenic, and reproductive effects, neurotoxin, allergies

Vaccine(s) containing it: Adenovirus, FluMist, MMRV, Varicella (chickenpox), Shingles

Mercury (Thimerosal, preservative)

What CDC says: neurotoxin, kidney poison

What others say: mad hatter syndrome, minute amounts cause nerve damage, symptoms of mercury toxicity are similar to autism

Vaccine(s) containing it: DT, flu, MPSV4, Td

Ammonium sulfate

What CDC says: only concerned with it in concentration

What others say: suspected gastrointestinal, liver, nerve, and respiratory system poison

Vaccine(s) containing it: DT, DTaP, Pentacel, Hib, Menactra, PCV13, Td, Tdap

Neomycin Sulfate (antibiotic)

What CDC says: nothing

What others say: interferes with B6 absorption (can cause mental retardation and rare form of epilepsy)

Vaccine(s) containing it: almost all

Polysorbate 80

What CDC says: nothing

What others say: known carcinogen in animals

Vaccine(s) containing it: almost all

Beta-Propiolactone

What CDC says: nothing

What others say: suspected gastrointestinal, liver, nerve, and respiratory system poison

Vaccine(s) containing it: Flu, Rabies

Gentamicin Sulfate & Polymyxin B (antibiotics)

What CDC says: nothing

What others say: can cause life-threatening allergic reactions

Vaccine(s) containing it: Flu, Polio, Smallpox, DTaP-IPV, DTaP-HepB-IPV, DTaP-IPV-Hib

Phenol/phenoxyethanol (antifreeze)

What CDC says: only concerned with it in concentration

What others say: Toxic to all cells. Capable of disabling the immune system's primary response mechanism

Vaccine(s) containing it: most

Other Ingredients

Genetically modified yeast, animal, bacterial, and viral DNA; latex rubber; egg protein; gelatin; glutaraldehyde; benzethonium chloride; methylparaben; lake dyes; cancer cells

Other Vaccine Contaminants:

Human diploid cells

- MRC-5 cells derived from the normal lung tissue of a 14-week old male fetus in 1966
- WI-38 cells were derived from lung tissue from a 3 month aborted female fetus in 1962
- Used for MMR, Chickenpox, HepA, Rabies, Shingles, and Adenovirus, Pentacel

Potential problems: cell lines can become contaminated with viruses, cell lines have 100 times greater propensity to degenerate to neoplastic states with unknown consequences.

Bovine sera

- Used for MMR, Chickenpox, IPV, Prevnar, and Pneumovax

Potential problems: nearly 100% of commercially available sera is contaminated with viruses including: bovine diarrhea virus, bovine leukemia virus, bovine immunosuppressive virus, bovine herpesvirus-4 and herpesvirus-8, bovine polyoma-virus, mycoplasma

Mycoplasma

- Does not grow as colonies
- Cannot be detected by light microscopy
- Dr. Charles Engel said in an NIH meeting on 2/7/2000, "I am now of the view that the probable cause of chronic fatigue syndrome and fibromyalgia is the mycoplasma..."

Potential problems: mycoplasma can cause changes in cell growth characteristics, inhibition of cell metabolism, disruption of nucleic acid synthesis, chromosomal aberrations, and altered transfection rates and virus susceptibility.

VERO cells

- Continuous cell line from African green monkey (known to contain SV40)

Potential problems: linked to non-Hodgkin's lymphoma. SV40 found in 36% of brain tumors and 22% of semen samples

Avian sources

- Used for Influenza, Mumps, Measles, & Yellow Fever

Potential problems: known contaminants include avian leukemia virus (a parent virus for: avian sarcoma virus, avian myeloblastosis virus, avian erythroblastosis virus, and avian myelocytomatosis virus)

How to Recognize Vaccine Reactions*

High Fever (over 103° F)

“Her temperature soared to 105.”

Skin (hives, rashes, swelling)

“There was a big, hot, swollen lump at the site of the shot that stayed for weeks.”

High Pitched Screaming

“It was a pain cry, a shrill scream, and lasted for hours and nothing would help.”

Collapse/Shock

“She turned white with a blue tinge around her mouth and went completely limp.”

Excessive Sleepiness

“He passed out, and we couldn’t wake him to feed or do anything for over 12 hours.”

Convulsion

“Her eyes twitched, her chin trembled, her body went rigid and then would shake.”

Brain Inflammation

“He just laid in his crib with his eyes wide open then would arch his back and scream and go unconscious. Now he has seizures.”

Behavior Changes

“She won’t sleep or eat. She throws herself down and screams for no reason. She was sweet and happy and is now out of control. She changed into a totally different child.”

Mental/Physical Regression

“My 18 month old son stopped talking and walking. He developed severe allergies, constant diarrhea, ear infections, and was sick all the time”

Other reactions include: loss of muscle control, paralysis, regressive autism, arthritis, blood disorders, diabetes, and sudden death.
